Integrating this expression allows us to find the first-rate order for the hydrolysis of methyl methanoate, shown below; $\ln[\text{Ester}]_t - kt = \ln[\text{Ester}]_0$ Where $[\text{Ester}]_0$ equal to the initial concentration of the ester before hydrolysis process and $[\text{Ester}]_t$ equal to the concentration of the ester at a given time, allowing us to calculate the rate of reaction at any specific time throughout the hydrolysis process.
